MULTIMEDIA UNIVERSITY

FINAL EXAMINATION

TRIMESTER 1, 2017/2018 SESSION

TDS 3301 – DATA MINING

(All Sections / Groups)

14 OCTOBER 2017

2:30 p.m – 4:30 p.m

(2 Hours)

INSTRUCTIONS TO STUDENTS

1. This Question paper consists of 4 printed pages including cover page with 4 questions only.
2. Attempt **ALL** questions. All questions carry equal marks and the distribution of marks for each question is given.
3. Please write all your answers in the Answer Booklet provided

Question 1

A survey was conducted to study the percentage of salary an adult spend on entertainment. The **sample** of 10 randomly selected adults are tabulated as follows.

Age	23	38	35	32	46
%Salary	16.1	17.3	27.2	19.8	22.7
Age	17	41	27	34	26
%Salary	13.6	20.2	20.7	20.5	15.6

Present your final answers in two decimal places.

- Calculate the *mean* and *standard deviation* for age and % salary. (2 marks)
- Normalize the age and % salary using *z-score normalization*. Present your answer in a tabulated form. (2 marks)
- Use your answer in (b) to calculate the *correlation coefficient* between age and % salary. Show your steps and justify whether they are *positively* or *negatively correlated*. (4+1 marks)
- Give a reason why $n-1$ for calculating variance of a sample? (1 mark)

Question 2

- Subjective measure* is sometime used to determine the quality of association rules. Explain the measure in brief. (1 marks)
- Objective measure, on the other hand, uses support and confidence to determine the quality of association rules. What are *support* and *confidence*? (2 marks)
- What are *exact rules* and *strong rules*? (2 marks)
- Explain *frequent item set* and *Apriori property* of Apriori algorithm. (2 marks)
- A transaction database is given as follow. Let minimum support = 60% and minimum confidence = 80%. Generate *frequent item sets* using Apriori. Show your steps. (3 marks)

Transaction	Items
T1	{a,b,c,d,e,f}
T2	{g,b,c,d,e,f}
T3	{a,h,d,e}
T4	{a,i,j,d,e}
T5	{j,b,f,d,k,e}

Continued...

Question 3

- What is the *simplified assumption* made for attributes used in the Naïve Bayes classifier (NBC)? (1 mark)
- What is the *advantage* and *disadvantage* of making assumption as in (a)? (2 marks)
- Suggest a *classification algorithm* to overcome the disadvantage of NBC. (1 mark)
- The test data of a car is given as follows. Use NBC and the train data to determine whether or not the car is stolen. (6 marks)
Test data: Colour = "Red", Type="SUV", Origin="Domestic"

Train data:

Car Plate	Colour	Type	Origin	Stolen?
AAA1234	Red	Sports	Domestic	Y
BBB1235	Red	Sports	Domestic	N
CCC1236	Red	Sports	Domestic	Y
DDD1237	Yellow	Sports	Domestic	N
EEE1238	Yellow	Sports	Imported	Y
FFF1239	Yellow	SUV	Imported	N
HHH1240	Yellow	SUV	Imported	Y
III1241	Yellow	SUV	Domestic	N
JJJ1242	Red	SUV	Imported	N
KKK1243	Red	Sports	Imported	Y

Question 4

Five points are given as follows with x and y representing their locations.

A(1,8), B(7,2), C(2,1), D(8,4), E(7,0)

- A and E are randomly selected centroids for Cluster1 and Cluster2, respectively. Use *Euclidean* as distance function, determine which cluster point C should belong to. (3 marks)
- After the first round execution of k-means, assume that B,C, D and E belong to Cluster2. Draw a *scatter plot* for these five points. On the plot, group these points into two clusters manually. (2+1 marks)
- What is the *new centroid* for Cluster2? (2 marks)
- Can k-means handle outliers efficiently? Why or why not? (2 marks)

Continued...

Formulae:

$$\text{Standard deviation, } \sigma = \sqrt{\frac{\sum_{i=1}^n x^2}{N} - \mu^2}$$

$$\text{Z-score normalization } v' = \frac{v - \mu}{\sigma}$$

$$\text{Covariance } Cov(A, B) = E(A \cdot B) - \bar{A} \bar{B}$$

$$\text{Correlation analysis } r_{A,B} = \frac{Cov(A,B)}{(n-1)\sigma_A\sigma_B}$$

$$\text{NBC, } P(C_i|X) = P(X|C_i)P(C_i)$$

$$\text{Euclidean distance, } d(X, Y) = \sqrt{|x_2 - x_1|^2 + |y_2 - y_1|^2}$$
